M26 (H7) field test report

Generated 14 June 2026 · snapshot 14 Jun 2026, 17:01 NZST
Devices: H7 = One NZ M26 quote handset · H6 = Samsung Galaxy S21 (reference)

1. GPS moving test (11:30–11:45 NZST, 14 Jun 2026)

~15 min drive (~10 km) with both phones logging to RNZ Recorder at ~1 Hz GPS. Same vehicle, simultaneous upload.

Metric	H6 (S21)	H7 (M26)
GPS fixes	956	959
Fix rate	1.00 Hz	1.00 Hz
Max fix gap	2.0 s	1.0 s
Track distance	9.90 km	9.95 km
Median accuracy	5.2 m	3.3 m
p90 accuracy	7.6 m	5.2 m

Track agreement (± 3 s time match): 100% of H6 fixes matched · median separation **4.2 m** (p90 7.5 m).

Verdict: Both handsets are production-ready at ~1 Hz for regatta tracking. M26 (H7) shows better raw GPS accuracy (median ~3.3 m vs ~5.2 m on S21) with comparable fix continuity.

2. H7 battery endurance (14 Jun 2026)

Continuous session from 14 Jun 2026, 06:45 at 96% through 14 Jun 2026, 17:01 NZST — test complete after 10.3 h.

Parameter	Value
Session start	14 Jun 2026, 06:45 at 96%
Session end (14 Jun 2026, 17:01)	64% · device offline
Elapsed	~10.3 h
Total drop	32% (96% → 64%)
Estimated drain	~3.1 %/h (1 Hz GPS + background recording)
Est. runtime from 100%	~32 h at similar load
App cellular data	36 MB (OS-reported, full session)
Ingest	0.3 Hz GPS · 2173 total samples

- Compare to prior A1 long-session reference: ~3.7 %/h at 30 s GPS (~27 h from full charge).
- M26 at 1 Hz: ~3.1 %/h — an 8 h regatta day uses ~25% at this rate; mixed profile uses less.
- Cellular data ~36 MB over 10.3 h (~3.5 MB/h) at 1 Hz GPS + background upload.
- Battery % is reported by the native app on GPS/heartbeat samples (~10 min cadence).

3. Conclusion

- M26 validated for fleet use: production-ready GPS at ~1 Hz with better accuracy than S21 reference.
- Battery supports full regatta day without mid-charge: 10.3 h continuous test used 32% with 36 MB data.
- Full report archived on Documents hub (*documents.html*) with live battery chart.
