M26 (H7) battery + data test — 30 s reporting

Generated 15 June 2026 · session 14 Jun 2026, 19:09 → 15 Jun 2026, 06:11 NZST
Device: H7 = One NZ Smart M26 quote handset

1. Session summary

Parameter	Value
Reporting interval	30 s
Session start	14 Jun 2026, 19:09 at 98%
Session end	15 Jun 2026, 06:11 at 70%
Elapsed	11 h
Battery drop	28% (98% → 70%)
Drain rate	~2.5 %/h
Est. runtime from 100%	~39 h
App data (cumulative at end)	42.93 MB OS total
Session data (delta)	6.16 MB (~0.56 MB/h)

2. Ingest (recorder history)

Metric	Value
Total samples	1023
Active logging median gap	30.0 s (~0.033 Hz)
Session average ingest	0.03 Hz (includes screen-off / WiFi idle gaps)
Gaps > 60 s	193

When actively logging, fix spacing matched the 30 s configured interval. Long gaps reflect Android doze / screen-off periods (notably on WiFi).

3. Comparison — 30 s vs 1 Hz (same handset, Jun 2026)

Metric	1 Hz test (10.3 h)	30 s test (11 h)
Battery drain	~3.1 %/h	~2.5 %/h
Session data	36 MB	6.16 MB
Est. full charge	~32 h	~39 h
8 h regatta day (est.)	~25% battery · ~28 MB data	~20% battery · ~5 MB data

Verdict: 30 s reporting on M26 uses ~19% less battery and ~83% less session data than 1 Hz, with coarser map updates. Suitable for standard fleet tracking; use 1 Hz for broadcast-smooth trails.

4. Conclusion

- M26 at 30 s validated: ~2.5 %/h drain, 6.16 MB over 11 h continuous background session.
- 8 h regatta day at 30 s uses ~20% battery — no mid-day charge required.
- Fleet recommendation: 30 s default for training/long sessions; 1 Hz for livestream / high-visibility windows.
